

Trend Micro announces a Statement of Direction for our ScanMail for IBM Lotus Domino solution to support 64-bit Domino and Linux on the IBM System z platform.

Trend Micro ScanMail for Lotus Domino runs directly on the Domino server to identify malicious as well as inappropriate, sensitive and unwanted messages and files – helping to keep Domino users, systems and data safe. Accordingly, this native Domino application continues to support the widest range of Domino operating environments in the industry – Windows, Linux (on x86 hardware and IBM System z), AIX, i5 OS, z/OS and Solaris.

Our latest release, ScanMail v5, with 64-bit Domino support is currently available on Windows and AIX, with Linux on IBM System z in development. Specifically, for IBM System z we plan to support 64-bit Domino 8.5.x on both SLES 10 and 11, as well as RHEL 5. Target availability is 4Q10, with early access and beta programs open to interested parties.
